

AMSC/MATH 420, Spring 2014

First Project on Modeling Epidemics: Geographical Dependence of Parameters

Oral presentation due Monday March 10

Written presentation due Friday March 14

Monthly data on AIDS diagnoses in various metropolitan areas (and the entire U.S.) is available at <http://wonder.cdc.gov/aids-v2002.html>. To download data for a particular city (and its metropolitan area), select “Month Diagnosed” in Section 1 next to “Group Results By”, and select the city name in Section 2. Then click any of the “Send” buttons. Once the data appears, you can save the data to a file with the “Export” button, but it may be just as easy to copy-and-paste. In addition to selecting data by region, you can select by demographic information, risk factors, etc.; for now, let’s stick to all diagnoses in a given region. From the monthly data, you can compute the cumulative number of diagnosed cases as a function of time.

Start by downloading monthly AIDS diagnoses data for the San Diego and San Francisco reporting areas. The goals of this project are to develop and test methods for fitting parameters of a modified SIR model (to be discussed further in class) to the data, to find parameters that best fit the data for these and several other western U.S. cities, to interpret and compare the parameters found for different cities, and to quantify how the parameters correlate with demographic information about the cities.
